

## Student Data Overview

- 1) Transfer work received by UARS from one or more transfer institutions.
- 2) TI source data entered into NDARS via Source Editor (Native DARS Power Builder interface).
- 3) Transfer audits are performed iteratively with manual adjustments and exceptions until deemed certifiable then locked.
- 4) Upon locking the certified transfer articulation is stored and updates to SRS are made via the TRCR/D and Proficiency Web Services.

- 1) AP Test and SAT scores received by UARS.
- 2) UARS updates best and cumulative test tables.
- 3) CIS imports best table data via daily interface.
- 4) NDARS triggers a transfer audit run for students with changes (new best score info).
- 5) The new score-based credit is articulated along with any existing TI source data to create a new composite articulation audit. If the original transfer articulation was **unlocked**, processing stops and the new composite audit is left unlocked. If the original transfer articulation was **locked**, then the new composite audit is locked and stored and SRS is updated via the TRCR/D and Proficiency Web Services.

1) UCLA coursework, profile data, and proficiency values are queried from SRDB using a stored procedure.

1) Completed degree audits result in the generation of a PDF and SRS is updated via the Proficiency Web Service when appropriate.

## Less Common Components

- 1) Some students will require exceptions (formally known as substitutions and exemptions). These will be entered by departmental staff via Counselor Desktop and centrally by administrative staff (RO, CIS etc.).
- 2) Daily system updates from SRDB will pre-populate fields for UARS usage of the source editor.
- 3) Requests for audits from the legacy system will be processed via the existing Web Service for "small" numbers and via the existing batch process for "large" requests.
